

What Do My Cholesterol Levels Mean?

High blood cholesterol signals a higher risk of heart attack and stroke. That's why it's important to have your cholesterol levels checked regularly and discuss them with your doctor. A "lipoprotein profile" is a test to find out your blood cholesterol numbers. It gives information about total cholesterol, LDL ("bad") cholesterol and HDL ("good") cholesterol, as well as triglycerides (blood fats).

What should my total cholesterol level be?

Total Blood Cholesterol Levels:

Less than 200 mg/dL = Desirable (lower risk)

200 to 239 mg/dL = Borderline high (higher risk)

240 mg/dL and above = High blood cholesterol (more than twice the risk as desirable level)

What should my HDL and LDL cholesterol levels be?

HDL stands for high-density lipoprotein. HDL is "good" cholesterol because it seems to lower your risk of heart attack and stroke. That means that — unlike other cholesterol levels — the higher your HDL cholesterol, the better. You can raise your HDL cholesterol by quitting smoking, losing excess weight and being more physically active.

HDL Cholesterol Levels:

Less than 40 mg/dL for men = Low HDL (higher risk)

Less than 50 mg/dL for women = Low HDL (higher risk)

40 to 59 mg/dL = The higher, the better

60 mg/dL and above = High HDL (lower risk)

LDL stands for low-density lipoprotein. This is the main carrier of harmful cholesterol in your blood. A high level of LDL cholesterol means there's a higher risk of heart disease and stroke.

LDL Cholesterol Levels:

Less than 70 mg/dL = Optional goal if you're at very high risk of a heart attack or death from heart attack.

Less than 100 mg/dL = Optimal for people with heart disease or diabetes

100 to 129 mg/dL = Near or above optimal

130 to 159 mg/dL = Borderline high

160 to 189 mg/dL = High

190 mg/dL and above = Very High

What should my triglyceride level be?

Triglycerides are the most common type of fat in your body. They're also a major energy source. They come from food, and your body also makes them. As people get older, gain excess weight or both, their triglyceride and cholesterol levels tend to rise. Many people who have heart disease or diabetes have high fasting triglyceride

(continued)

levels. Some studies have shown that people with above-normal fasting triglyceride levels (150 mg/dL or higher) have a higher risk of heart disease and stroke.

Triglyceride Levels:

Less than 150 mg/dL = Normal

150 to 199 mg/dL = Borderline High

200 to 499 mg/dL = High

500 mg/dL and above = Very High

My Cholesterol and Triglyceride Levels

Use the chart below to keep track of your cholesterol and triglyceride levels each time you have a test. Make sure you discuss these numbers with your doctor.

HOW CAN I LEARN MORE?

- 1 Talk to your doctor, nurse or other healthcare professionals.** If you have heart disease or have had a stroke, members of your family also may be at higher risk. It's very important for them to make changes now to lower their risk.
- 2 Call 1-800-AHA-USA1** (1-800-242-8721), or visit heart.org to learn more about heart disease.
- 3** For information on stroke, call **1-888-4-STROKE** (1-888-478-7653) or visit us at StrokeAssociation.org.

Do you have questions for the doctor or nurse?

Take a few minutes to write your questions for the next time you see your healthcare provider.

For example:

What about other fats?

How often should I have my levels checked?
